SPONSOR MEETING | Week13 Semester1 2026

Project Final Status: Project Objectives

Three objectives define the final MVP scope and delivery status.

1 Baseline Model Selection

Focus

Implement Model C and Model D baseline scoring logic, compare their outputs, and select the stronger base model for further refinement.

Achieved — Model C selected

2 Accessibility & Usability Score Improvement

Focus

Upgrade Model C scoring for the two core outputs through Proposal 1 cap refinement and Proposal 2 time normalisation.

Achieved — scoring workflow upgraded

3 Tester Quality Rating

Focus

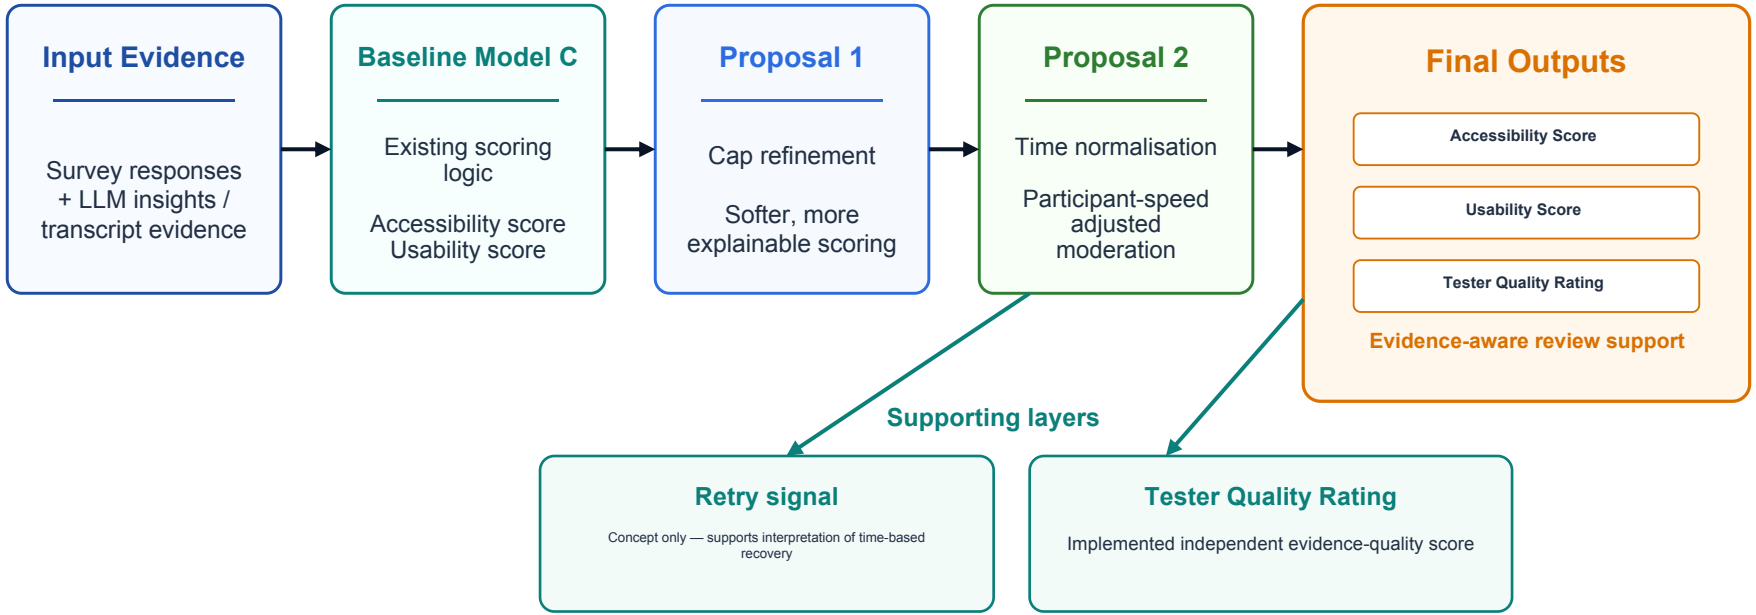

Build an independent evidence-quality score to assess tester feedback reliability and support review prioritisation.

Achieved — third score delivered

Overall Status Completed as a tactical Model C scoring improvement MVP; final handover and validation notes are in progress.

Project Final Status: Current Status

Final Model C MVP workflow from input evidence to three final outputs.

- √ Baseline scoring implemented
- √ Proposal 1 completed
- √ Proposal 2 completed
- √ TQ completed; retry conceptual

Expected Outcomes vs Final Delivery

Based on Week 4 status checking form and original proposal

Week 4 / Proposal Expected Outcome	Status	Final Evidence / Output
1. Baseline model implementation and model selection	Achieved	**Model C** and **Model D** baseline scoring logic were implemented and compared. Model C was selected as the base model for further iteration.
2. More reliable Accessibility & Usability scoring outputs	Achieved	**Proposal 1:** cap refinement / soft-cap logic to reduce overly harsh hard caps. **Proposal 2:** time normalisation to reduce raw-time bias and improve time-based usability moderation.
3. Tester Quality Rating and evidence review support	Achieved as staged extension	**Tester Quality Rating** was developed as an independent evidence-quality score to assess feedback reliability and support review prioritisation.

Note: Week 4 outcomes were intentionally broad; Proposal 1, Proposal 2 and TQ show how those outcomes were realised in the final MVP.

Outcome 1 — Model C & D Baseline Comparison

Achieved: baseline outputs compared, Model C selected for further refinement

Data evidence from Week 8 comparison

Metric	Model C	Model D	Interpretation
Mean accessibility score	**54.4**	**76.5**	D higher by 22.1
Mean usability score	**55.7**	**69.9**	D higher by 14.1
Mean stream average	**55.1**	**73.2**	D less conservative
Comparison base	**67 rows / 17 participants / 4 tasks**	**Same aligned subset**	Like-for-like comparison

Data-supported conclusion

What the data shows
Model D produced consistently higher outputs on the same aligned subset. The largest disagreements appeared in friction-heavy tasks, so the gap is behavioural, not just numerical.

Why Model C was selected
Model C is more conservative, cap-based, easier to explain, and safer to audit at the current MVP stage.

Why Model D was not selected
Model D is richer and more flexible, but its higher scores introduce greater validation, governance, and ethical review risk because serious friction may be under-represented.

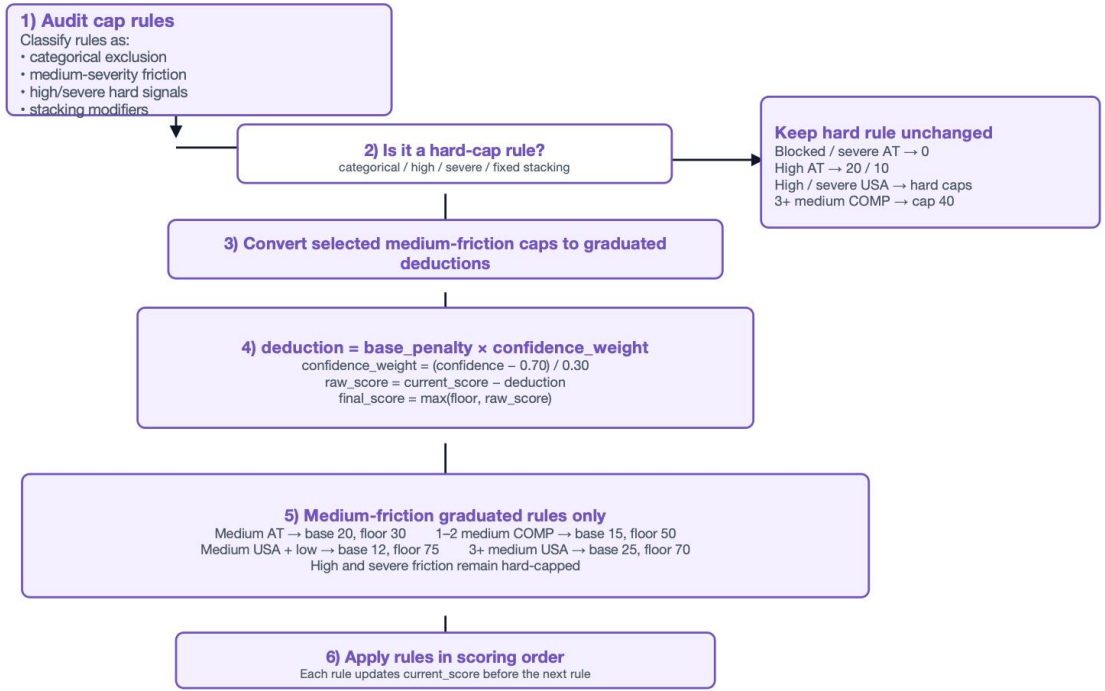

Final decision: Model C selected as the base model; Model D retained as a comparison reference.

ACHIEVED OUTCOME 1 | Baseline comparison completed → practical base model selected

Outcome 2A — Proposal 1: Cap Refinement Logic

Upgrading Model C by softening selected hard-cap deductions while keeping categorical exclusions intact

SECTION 1 — PROPOSAL 1: CAP REFINEMENT

Code / Output Demo Space

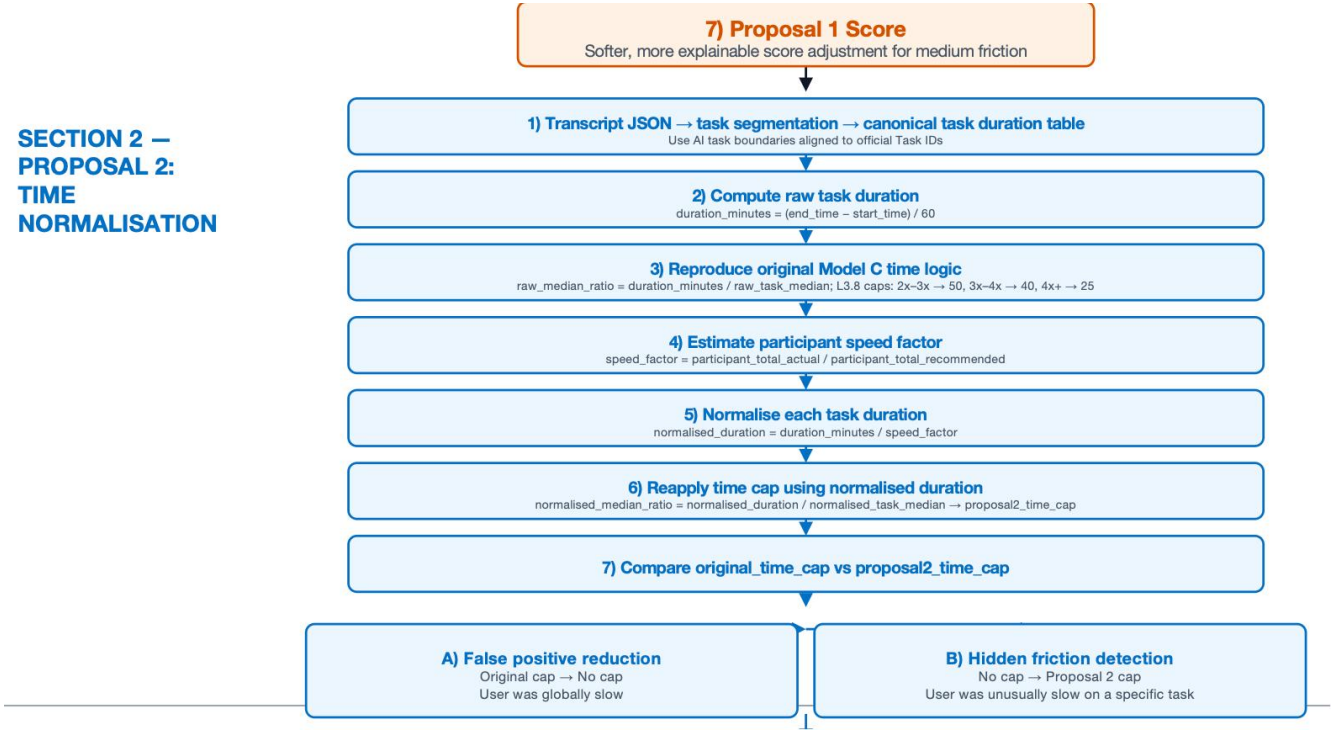

Baseline C3 cap / score (e.g., old hard-cap result)	Proposal 1 score (graduated deduction output)	Score change explanation (rule, confidence, floor)

Demo cue: show the Proposal 1 code/output table and explain how the same friction is handled more proportionately.

Outcome 2B — Proposal 2: Time Normalisation Logic

Adding participant-speed normalisation before applying Model C time-based moderation

SECTION 2 — PROPOSAL 2: TIME NORMALISATION

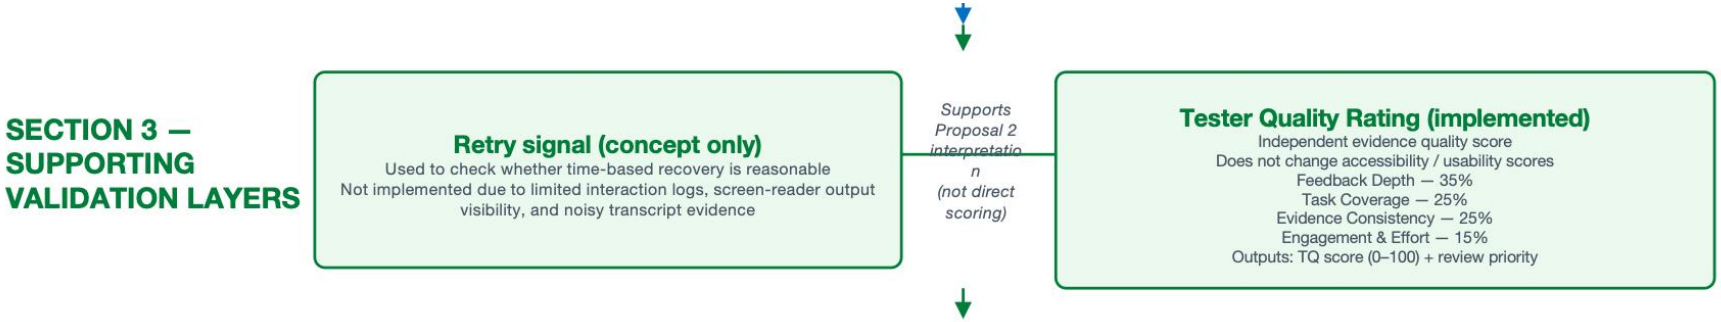

Code / Output Demo Space

Participant speed factor (actual / recommended)	Raw vs normalised duration (task-level comparison)	Original cap vs Proposal 2 cap (false positive / hidden friction)

Demo cue: show speed_factor, normalised_duration, original_time_cap, and proposal2_time_cap columns.

Outcome 3 — Supporting Validation & Review Logic

Using retry as a future support signal and Tester Quality Rating as an implemented evidence-quality score

Code / Output Demo Space

Retry signal notes (concept only; logging limits)	Tester Quality Rating output (TQ score 0–100)	Review priority (flagged / uncertain cases)

Demo cue: show the TQ output summary and explain that retry supports interpretation, not direct scoring.

Expected Outcomes Deviation: Scope Refinement

No major expected outcome was missed — the final MVP narrowed and evolved as the evidence became clearer.

How the project scope evolved

Week 4 direction
Broad exploration of scoring models, multimodal data, and long-term enhancement areas.

→

Mid-project learning
C/D output comparison, client feedback, and data limitations clarified what was practical.

→

Final MVP focus
Model C upgrades with Proposal 1, Proposal 2, TQ, and review support.

Large initial scope
many possible signals and models

→

Evidence filtering
prioritise what data can support

→

Focused delivery
practical scoring workflow

Deviation / Reason

1. Broad scope narrowed to Model C MVP

Scope refinement

C/D comparison and client feedback showed Model C was the practical base for explainable refinement.

2. Retry not used as direct scoring logic

Implementation adjustment

Current data lacks clean interaction logs and reliable screen-reader output separation; retry remains a supporting signal.

3. Tester Quality Rating added as final output

Added value

Evidence quality became important for interpreting scoring outputs and prioritising manual review.

Bottom line: The deviations reflect a controlled shift from broad exploration to a practical, evidence-aware Model C scoring MVP.

These are not missed outcomes; they are justified adjustments to keep the final delivery realistic, testable, and aligned with available data.

Final Deliverables

Handover package for the Model C scoring improvement MVP

1 Code Workflows

REPRODUCIBLE WORKFLOW

- Existing notebooks for Proposal 1, Proposal 2, manual review and TQ
- Reusable Python scripts
- README_How_To_Run

2 Scoring Output Tables

MODEL OUTPUTS

- Baseline Model C outputs
- Proposal 1 and Proposal 2 results
- Participant, task and project summaries

3 Evidence Review Outputs

REVIEW SUPPORT

- Manual review cases and rubric
- Validation summary and error details
- Retry supporting-signal framework

4 Tester Quality Rating

INDEPENDENT EVIDENCE SCORE

- TQ features, scores and summary
- Review-priority outputs
- Unmatched participant checks

5 Prepared Data & Segments

DATA PACKAGE

- Survey, task and insight data
- Project metadata
- Combined and participant-level segmentation files

6 Client Documentation

CLIENT-FACING MATERIALS

- Weekly slides and meeting minutes
- Project documentation and logic explanations
- Demo video and handover package

Final handover = reproducible Model C scoring workflow + output tables + evidence-review support + documentation.

Storage

Documentations on Google drive:
